Visity Launches AI-Powered Property Intelligence Platform Built on a Nationwide Network of Real Estate Professionals

New platform delivers scalable property condition assessments, occupancy verifications, disaster inspections, and field data collection services across the United States.

PHOENIX, Arizona — Visity today announced the launch of its nationwide property intelligence platform, designed to help lenders, mortgage servicers, insurers, investors, and property management organizations obtain timely, reliable property intelligence from virtually any location in the United States.

Organizations today face increasing pressure not only to monitor property conditions, verify occupancy status, assess disaster impacts, and maintain accurate portfolio data, but also to transform growing volumes of field observations into meaningful business intelligence. Traditional inspection models often excel at delivering individual reports, yet they provide limited ability to analyze trends, identify portfolio-wide risks, or extract actionable insights from thousands of completed inspections. Visity addresses these challenges by combining three essential capabilities: a nationwide network of qualified real estate professionals, proprietary mobile technology that standardizes high-quality field data collection, and AI-powered property intelligence that transforms inspection data into actionable business insights.

The platform enables clients to order a variety of field services, including property condition inspections, occupancy verifications, disaster assessments, and custom property data collection assignments. Local field representatives use the Visity mobile application to capture GPS-verified photographs, observations, and structured property information. Artificial intelligence then extends the value of every inspection beyond the initial report. Organizations can summarize findings, identify trends across portfolios, compare conditions by geography, surface properties requiring attention, and ask natural-language questions of their inspection data. By transforming structured field observations into searchable property intelligence, Visity helps clients make faster, more informed business decisions.

"The future of property inspections isn't just about collecting more data — it's about delivering better property intelligence," said Kevin Musick, founder of Visity. "For too long, the industry has focused on answering the question, 'Who can inspect this property?' We believe the more important question is, 'How can organizations extract lasting value from the property information they collect?' Most organizations already possess enormous amounts of transactional property data, but very little of it becomes organizational

knowledge. That's where the combination of trusted professionals, intelligent mobile technology, and AI-powered property intelligence changes the equation."

Rather than viewing each inspection as a standalone transaction, Visity treats every field assignment as a source of structured property intelligence. Information collected by qualified local professionals using standardized mobile workflows becomes part of a growing body of data that organizations can analyze across individual properties, geographic regions, or entire portfolios. This approach not only delivers timely inspection results but also helps organizations identify trends, monitor changing conditions, and make more informed operational and investment decisions.

The launch reflects a broader evolution in how organizations think about field operations. As lenders, insurers, investors, retailers, and property managers collect increasing volumes of property data, competitive advantage will come not simply from gathering information, but from transforming that information into actionable intelligence. By its approach, Visity is redefining how organizations understand and manage their real estate assets.
